

We have N books in our library. Author, title, page numbers of books are stored in our database. Design and write a C++ program which read in the data and answer the following questions! (At first use constant input!)

- a) Is there a book from Hamingway?
 - b) Which book (with author and title) is the longest one?
 - c) How many book's titles are longer than 20 characters?
-
1. Specification (collecting data, conditions)
 2. Which algorithm patterns are used?
 3. Algorithm (draw an NSD, you can use PFW – start in <http://xml.inf.elte.hu>)
